SLEEP TRACKING

INTRODUCTION:

- *Sleep tracking is the process of monitoring a person's sleep, most commonly through measuring inactivity and movement. A device that tracks a person's sleep is called a sleep tracker. Devices capable of tracking a person's sleep include dedicated sleep trackers, trackers that clip onto a person's pillow, smartphones, fitne ss trackers, smartwatches, and other wearable devices.*
- *Some sleep trackers are capable of tracking the stages of a person's sleep (light sleep, deep sleep, rem sleep), the length/duration of a person's sleep, the quality of a person's sleep, and the consistency of a person's sleep.*
- *some sleep trackers offer other features, such as "Sleep scores" That rank how well a person slept, "Smart*

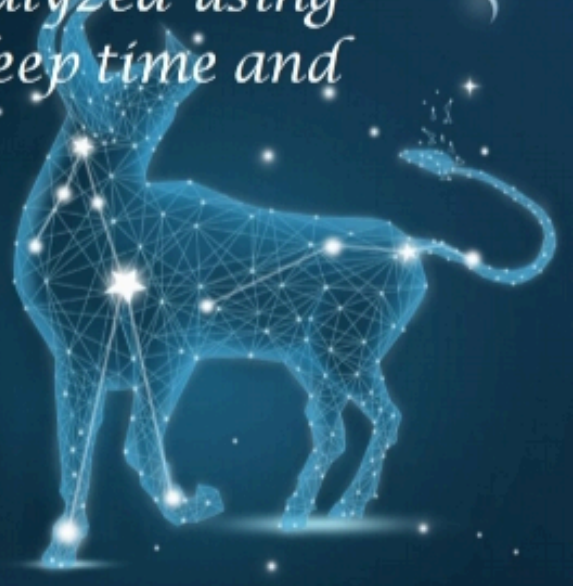
alarms" that wake a person up within a set period of time based on the circumstances of the person's sleep, and the ability to track the amount of light and/or the temperature in the person's bedroom.

- In a study published in the Journal of Clinical Sleep Medicine on February 15, 2017, researchers from Rush University Medical College and Northwestern University's Feinberg School of Medicine found that the three patients involved in the study using sleep tracking devices complained about the sleep data that was collected by applications and devices
from Nike, Apple, Fitbit and other companies.
- The researchers also found that the patients involved spent excessive time in bed in order to increase their

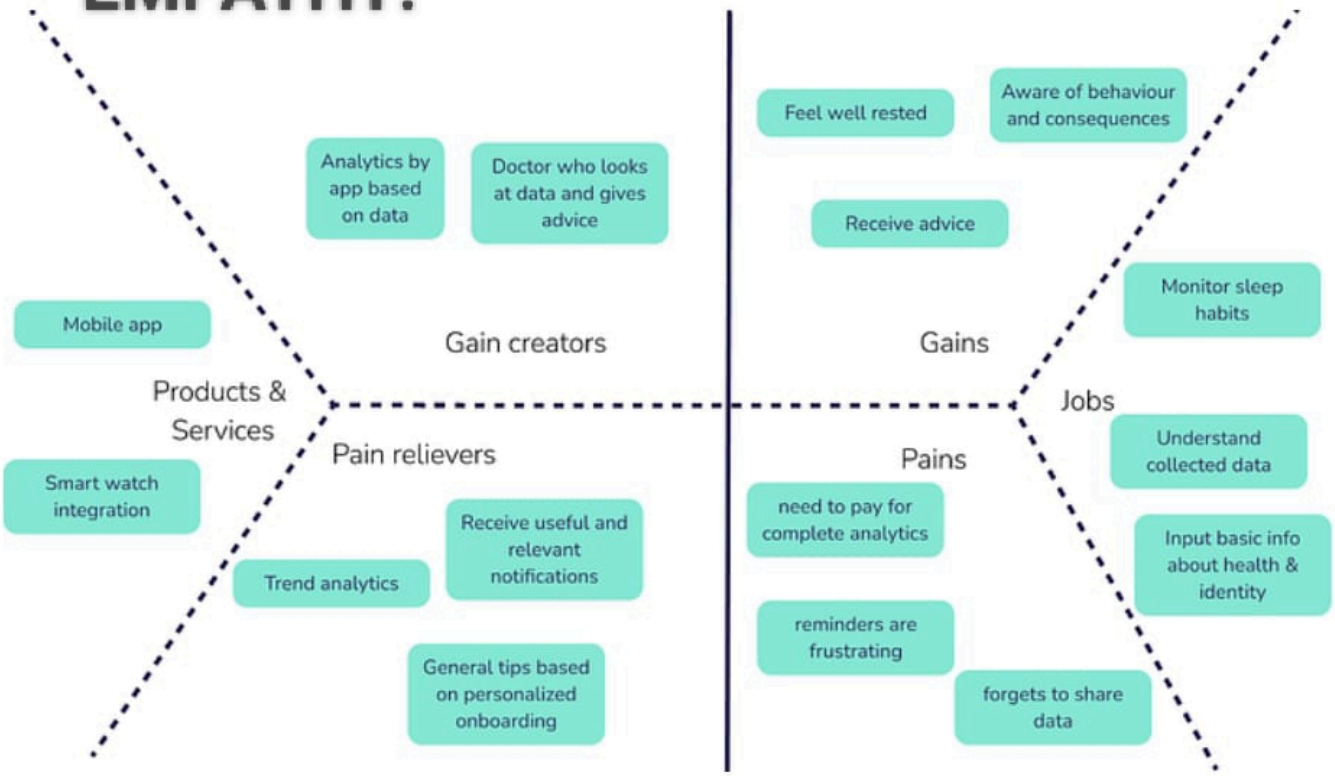
"sleep numbers", which may have actually made their insomnia worse.[9] The researchers involved in the study warned that sleep tracking devices could provide inaccurate data and worsen insomnia in the person using the device by making them unhealthily obsessed with achieving perfect sleep, a condition the researchers called orthosomnia, which they coined in the study.

❖ How do sleep trackers work

Most sleep trackers measure sleep quantity and quality by using accelerometers, small motion detectors. Accelerometers measure how much movement you're making while you sleep. This data is then analyzed using an algorithm to estimate sleep time and quality

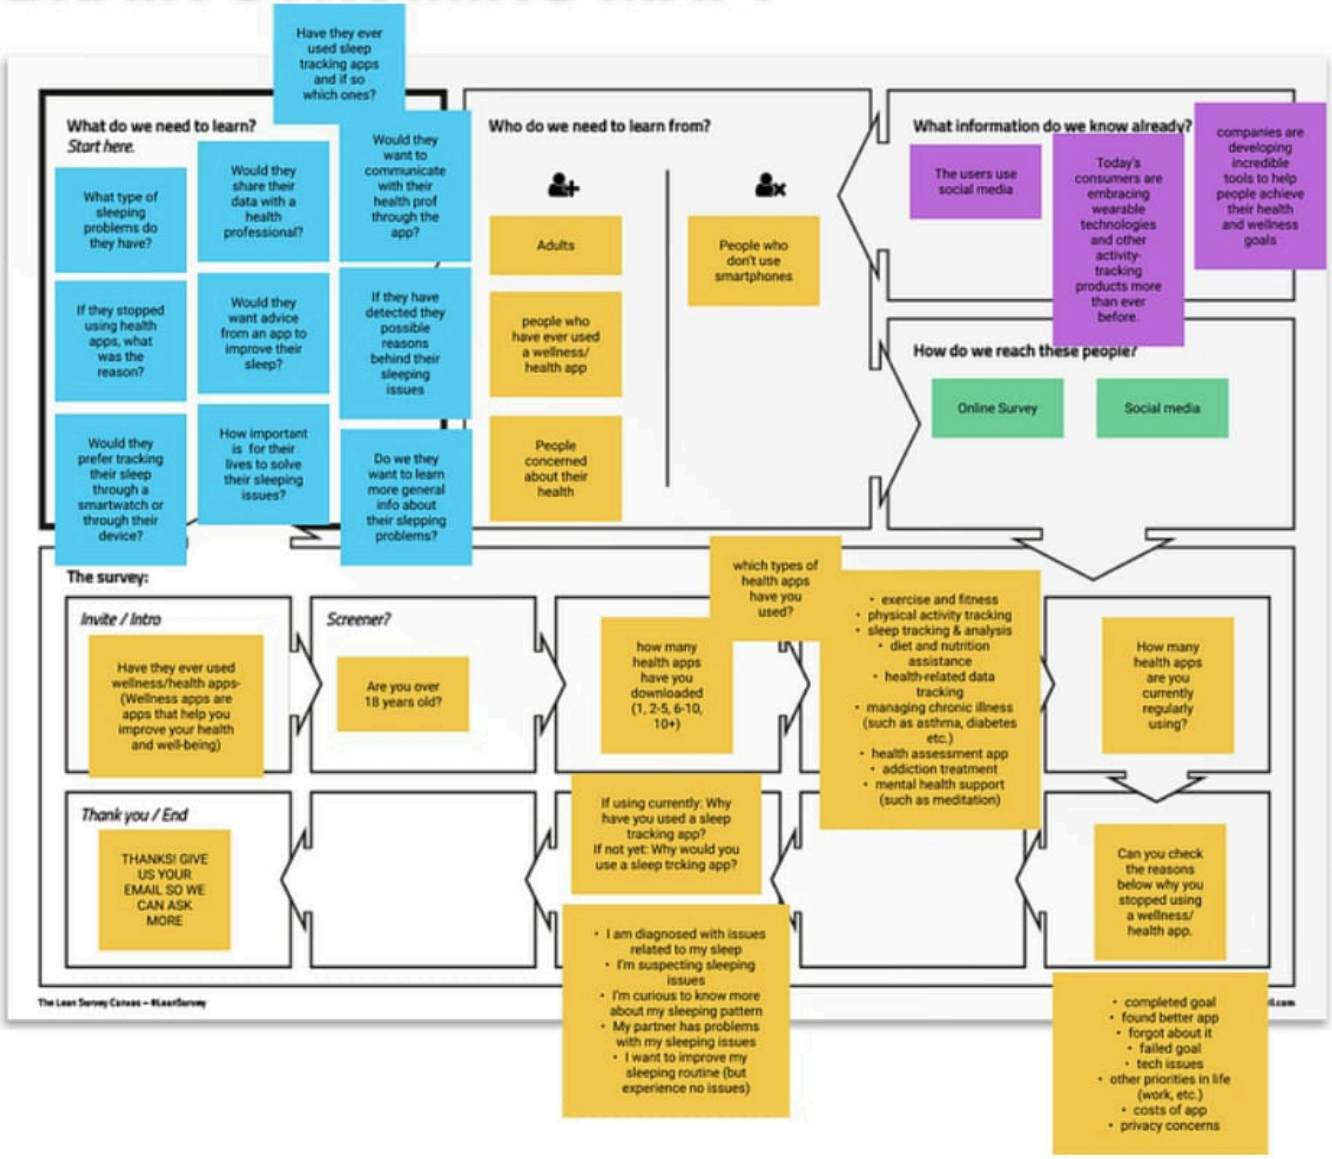


EMPATHY:

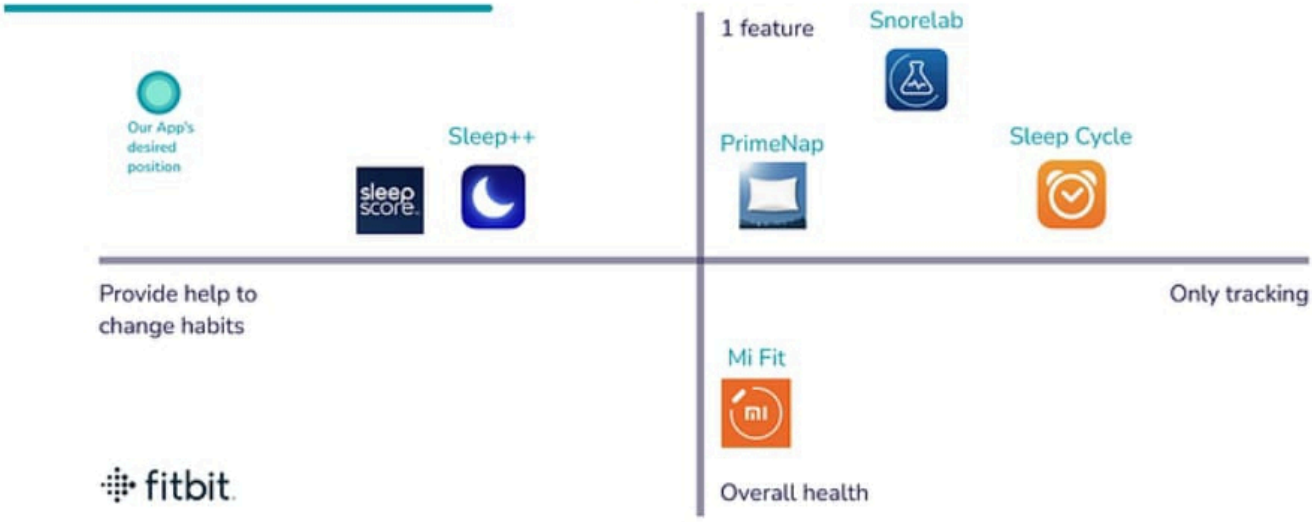


Products & Services
Gain creators
Pain relievers
Gains
Pains
Jobs
Mobile app
Smart watch integration
Analytics by app based on data
Doctor who looks at data and gives advice
Trend analytics
Receive useful and relevant notifications
General tips based on personalized onboarding
Feel well rested
Aware of behaviour and consequences
Receive advice
Monitor sleep habits
Understand collected data
Input basic info about health & identity
need to pay for complete analytics
reminders are frustrating
forgets to share data

BRAIN STROMING MAP:



Competitive Analysis



ADVANTAGES OF SLEEP:

- ✓ Adequate sleep helps with hormonal balance. That keeps your heart healthy, reduces stress, and helps keep blood sugar consistent. It also reduces stress, prevents inflammation, and helps control weight

DISADVANTAGE OF SLEEP:

- ✓ Too much sleep — as well as not enough sleep — raises the risk of chronic diseases, such as coronary heart disease, diabetes, anxiety and obesity in adults age 45 and older. Sleeping too much puts you at greater risk of coronary heart disease, stroke and diabetes than sleeping too little

COMMON SIGNS OF SLEEP DISORDERS INCLUDE:

- ✓ Trouble falling or staying asleep
- ✓ Still feeling tired after a good night's sleep
- ✓ Sleepiness during the day that makes it difficult to do everyday activities, like driving or concentrating at work
- ✓ Frequent loud snoring
- ✓ Pauses in breathing or gasping while sleeping
- ✓ Tingling or crawling feelings in your legs or arms at night that feel better when you move or massage the area
- ✓ Feeling like it's hard to move when you first wake up

What Do Sleep Trackers Monitor?

A wide variety of sleep trackers have hit the market, with more being released all the time. Many are wearable trackers that you can strap to your wrist. Others clip on your pillow or sit on your bedside table.

Features of these devices vary, but some common capabilities include:

- **Sleep duration:** By tracking the time you're inactive, the devices can record when you fall asleep at night and when you stir in the morning.
- **Sleep quality:** Trackers can detect interrupted sleep, letting you know when you're tossing and turning or waking during the night.
- **Sleep phases:** Some tracking systems track the phases of your sleep and time your alarm to go off during a period when you're sleeping less deeply. In theory, that makes it easier for you to rouse.
- **Environmental factors:** Some devices record environmental factors like the amount of light or temperature in your bedroom.
- **Lifestyle factors:** Some trackers prompt you to enter information about activities that can affect sleep, such as how much caffeine you've had, when you've eaten or whether your stress level is high.

CONCLUSION

Lack of sleep will interfere with the natural healing process that takes place within the body, which is detrimental to health and wellness. Sleep is not only beneficial to physical health but to emotional health, safety and quality of life.

A Sleep Tracking App for a Better Night ‘s Rest
